

AMENDMENTS TO THE CLAIMS

Claims 1-59 (Canceled).

60. (New) A method comprising:
- storing on a receiver, a user-selected option, said option associated with an event in a video transmission;
- monitoring and storing one video transmission on said receiver while tuning said receiver to another video transmission, said monitoring to detect the event, said tuning to display said another transmission; and
- in response to detecting the event, queuing said stored one video transmission for display, said display of said one transmission from a predetermined time before the occurrence of the event.
61. (New) The method of claim 60 including displaying said another video transmission in a portion of a display screen while displaying said one video transmission.
62. (New) The method of claim 60 including replacing the display of said another video transmission with the display of said one transmission.
63. (New) The method of claim 60 including storing said another video transmission in a storage while displaying said one transmission.
64. (New) The method of claim 60 including storing more than one user-selected option, said options associated with different events in a video transmission.
65. (New) The method of claim 60 including storing a plurality of video transmissions and monitoring the transmissions for a user-selected option.
66. (New) The method of claim 60 including displaying said one video transmission from a time of about forty-five seconds prior to the occurrence of the event.
67. (New) The method of claim 60 including automatically queuing the stored one video transmission in response to detecting the event.

68. (New) The method of claim 60 including displaying a notification of the occurrence of the event and, in response to user input queuing the stored transmission.

69. (New) The method of claim 60 including monitoring and storing said one video transmission while displaying said one transmission.

70. (New) The method for claim 60 including displaying the queued one video transmission from a predetermined time before the occurrence of the event to a predetermined time after the event.

71. (New) The method of claim 60 including displaying the queued one video transmission from a user-defined time before the occurrence of the event.

72. (New) An article comprising a medium storing instructions that, if executed, enable a processor-based system to:

store on a receiver, a user-selected option, said option associated with an event in a video transmission;

monitor and store one video transmission on said receiver while said receiver is tuned to another video transmission, said another transmission to be displayed; and

in response to detecting the event, queue the stored one video transmission for display from a predetermined time before the occurrence of the event.

73. (New) The article of claim 72 further storing instructions that enable a system to display said another video transmission in a portion of a display screen while the one video transmission is displayed.

74. (New) The article of claim 72 further storing instructions that enable a system to replace the display of said another video transmission with the display of said one transmission.

75. (New) The article of claim 72 further storing instructions that enable a system to store said another video transmission in a storage while said one transmission is displayed.

76. (New) The article of claim 72 further storing instructions that enable a system to store more than one user-selected option, said options associated with different events in a video transmission.

77. (New) The article of claim 72 further storing instructions that enable a system to store a plurality of video transmissions and monitor the transmissions for a user-selected option.

78. (New) The article of claim 72 further storing instructions that enable a system to queue said one transmission from a time of about forty-five seconds prior to the occurrence of the event.

79. (New) The article of claim 72 further storing instructions that enable a system to automatically queue the stored one video transmission in response to detecting the event.

80. (New) The article of claim 72 further storing instructions that enable a system to display a notification of the occurrence of the event and, in response to user input queue the stored transmission.

81. (New) The article of claim 72 further storing instructions that enable a system to monitor and store said one video transmission while being displayed.

82. (New) The article of claim 72 further storing instructions that enable a system to display the queued one video transmission from a predetermined time before the occurrence of the event to a predetermined time after the event.

83. (New) The article of claim 72 further storing instructions that enable a system to display the queued one video transmission from a user-defined time before the occurrence of the event.

84. (New) a receiver comprising:

a processor;

a display device coupled to the processor; and

a storage coupled to said processor, said storage storing instructions that enable the processor to receive on a receiver, a user-selected option which is associated with an event in a video transmission, monitor and store one video transmission while said receiver is tuned to another video transmission, display said another video transmission on the display, and in response to detecting the event, queue the stored one video transmission to display on the display device from a predetermined time before the occurrence of the event.

D1
Comp.

85. (New) The receiver of claim 84 including a television system coupled to the receiver.

86. (New) The receiver of claim 85 including a remote control coupled to the receiver.

87. (New) The receiver of claim 84 wherein the display is a monitor.

88. (New) The receiver of claim 84 wherein the receiver is a set-top box.
